Wirechat Beta

Aggregations

This section demonstrates how to retrieve aggregate data, like message counts, to enhance data handling and performance.

Get Unread Message Counts

Retrieve the count of unread messages across all conversations or within a specific conversation.

Get Total Unread Messages Count for the User

```
$user->getUnreadCount(); // int
```

Get Unread Messages Count for a Specific Conversation

```
$conversation = $user->conversations()->first();
$user->getUnreadCount($conversation); // int
```

Using `withCount()`

Leverage the **`withCount()`** method to get the count of related models.

```
namespace Wirechat\Wirechat\Models\Conversation;

$conversations = Conversation::withCount('messages','participants')->get();

foreach ($conversations as $conversation) {
    echo $conversation->messages_count;
    echo $conversation->participants_count;

}
```

Preventing N+1 Issues

Use eager loading with the **`with()`** method to load related data in a single query and prevent N+1 issues.

```
$user = auth()->user();
$conversations = $user->conversations()->with('messages','lastMessage','participants')-
```
