Authorization

Panels offer flexible integration with multiple guards and middleware configurations to secure your application's routes and broadcasting channels. This guide will help you set up and manage these configurations in a simple and clear manner.

Guards

Guards determine how users are authenticated for each request. Laravel supports multiple guards, which you can configure via panels.

Default Guard Setup

A panel can define a single guard:

```
use Wirechat\Wirechat\Panel;

public function panel(Panel $panel): Panel
{
    return $panel
            //..
            ->guards(['web']);
}
```

No additional setup is needed if you are using the default **`web`** guard.

Using Multiple Guards

If your application uses multiple guards, such as **`admin`** and **`web`**, you can chain them in the panel:

```
use Wirechat\Wirechat\Panel;

public function panel(Panel $panel): Panel
{
    return $panel
            //..
            ->guards(['web', 'admin']);
}
```
