Wirechat Beta

Widget Component

For a completely dynamic experience, pass **`widget="true"`** to the **`chats`** component:

```
<div class="h-[calc(100vh_-_10.0rem)]">
    <livewire:wirechat.chats widget="true" />
</div>
```

When a conversation is clicked, an **`open-chat`** event is dispatched as a Livewire event. If the **`wirechat`** component is on the same page, it listens for that event and immediately loads the selected chat—no page refresh required.

Widget Events

When a component is used as a widget by passing **`widget="true"`**, it will no longer redirect or reload the page after certain actions. Instead, it will trigger several browser and Livewire events during conversation transitions. These events let you hook into and extend chat functionality at various points in the user flow. Here are the most common ones:

Event	Parameter	Description
`open-chat`	**`conversation`** (ID)	Fires when a chat is clicked in the **`chats`** component.
`close-chat`	**`conversation`** (ID)	Fires when a chat is closed (e.g., deleted, exited).
`chat-opened`	**`conversation`** (ID)	Fires once a chat is fully loaded as a widget.

By leveraging these events, you can customize the chat experience at every step—without ever disrupting Wirechat's seamless SPA like environment.
