Wirechat Beta

Layout

The chat system is designed to fit seamlessly into any Laravel application. By default, when you visit the panel index route, it uses its built-in layout. However, you may want to keep your existing header, footer, or navigation bar. You can easily override the default layout to match your application's style.

Overriding the Default Layout

By default, WireChat uses the package layout **`wirechat::layouts.app`**. You can replace this layout by defining your own via the panel:

```php
use Wirechat\Wirechat\Panel;

public function panel(Panel $panel): Panel
{
    return $panel
        ->id('chats')
        ->layout('layouts.app'); // Your custom Blade layout
}
```

Setting Up Your Layout

For the chat system to work properly, you'll need to include the required styles and assets. These files handle global styling, modals, and Livewire functionality. Add them directly to your Blade layout so they're always available.

```blade
<html>
   <head>
    @wirechatStyles
   </head>
  <body>
    <div class="h-[calc(100vh_-_20rem)]">
        {{ $slot }}
    </div>
   @wirechatAssets(panel:'chats')
  </body>
</html>
```

1. **`@wirechatStyles`** injects the necessary CSS for the chat
