Wirechat Beta

Web Push Notifications

Wirechat keeps you connected to your conversations even when you're not actively using the app. Unlike in-app alerts, these are global notifications that appear in your browser's notification tray. By harnessing the power of Service Workers and the Web Notifications API, Wirechat ensures you never miss an important message, no matter which tab or application you're using.

How It Works

Wirechat's service worker manages notifications by:

- Displaying alerts when the app isn't in focus.
- Automatically dismissing notifications when the related conversation is opened.
- Using tags based on conversation IDs to prevent duplicate alerts.

Installation

Publish the required service worker scripts with:

```
php artisan wirechat:setup-notifications
```

This command will:

- Publish Wirechat's service worker to **`public/js/wirechat/sw.js`**.
- Publish the main service worker script to **`public/sw.js`**.

Importing Wirechat's Service Worker

If you have a custom **`sw.js`**, simply import Wirechat's service worker by adding:

```
importScripts('/js/wirechat/sw.js');
```
