Wirechat Beta

Theme

WireChat supports full theme customization, allowing you to tailor the chat interface to match the look and feel of your application. Whether you're using dark mode, light mode, or your own custom palette, WireChat gives you the flexibility to define your own design system.

Changing the Colors

In the configuration, you can easily change the colors that are used. WireChat ships with 6 predefined colors that are used everywhere within the framework. They are customizable as follows:

```php
use Wirechat\Wirechat\Panel;
use Wirechat\Wirechat\Support\Color;

public function panel(Panel $panel): Panel
{
return $panel
    // ...
    ->colors([
        'primary' => Color::Blue,
        'danger' => Color::Rose,
        'gray' => Color::Gray,
        'info' => Color::Blue,
        'success' => Color::Emerald,
        'warning' => Color::Orange,
    ]);
}
```

The primary color is used as the main color for notifications.

Overriding the Primary Color

The most common customization is overriding the primary color, since this is the one used across WireChat as your brand color (buttons, highlights, notification indicators, etc.).
